# Disclosures

- Jeremy Hwang is a consultant for Allergan, but did not receive any commercial support from Allergan in the preparation of this course.
- David Jeng and Lyndon Lee have no financial disclosures related to the topics in this lecture
- The content and format of this course is presented without commercial bias and does not claim superiority of any product or service.

# Course Objectives

To be comfortable with:

- the basics of OCTs
- the utility of an anterior segment OCT
- the analysis of an RNFL OCT
- the retinal layers in a macular OCT
- Upcoming technologies

# Outline

- Background and History
- Anterior Segment
- Optic Nerve
- Macula
- New and Coming Applications

# What is OCT?

- “A method of using low-coherence interferometry to determine the echo time delay and magnitude of backscattered light reflected off an object of interest.” (Schuman JS 2008)

# How it Works

# Michelson Interferometer

Long Coherence Length Light

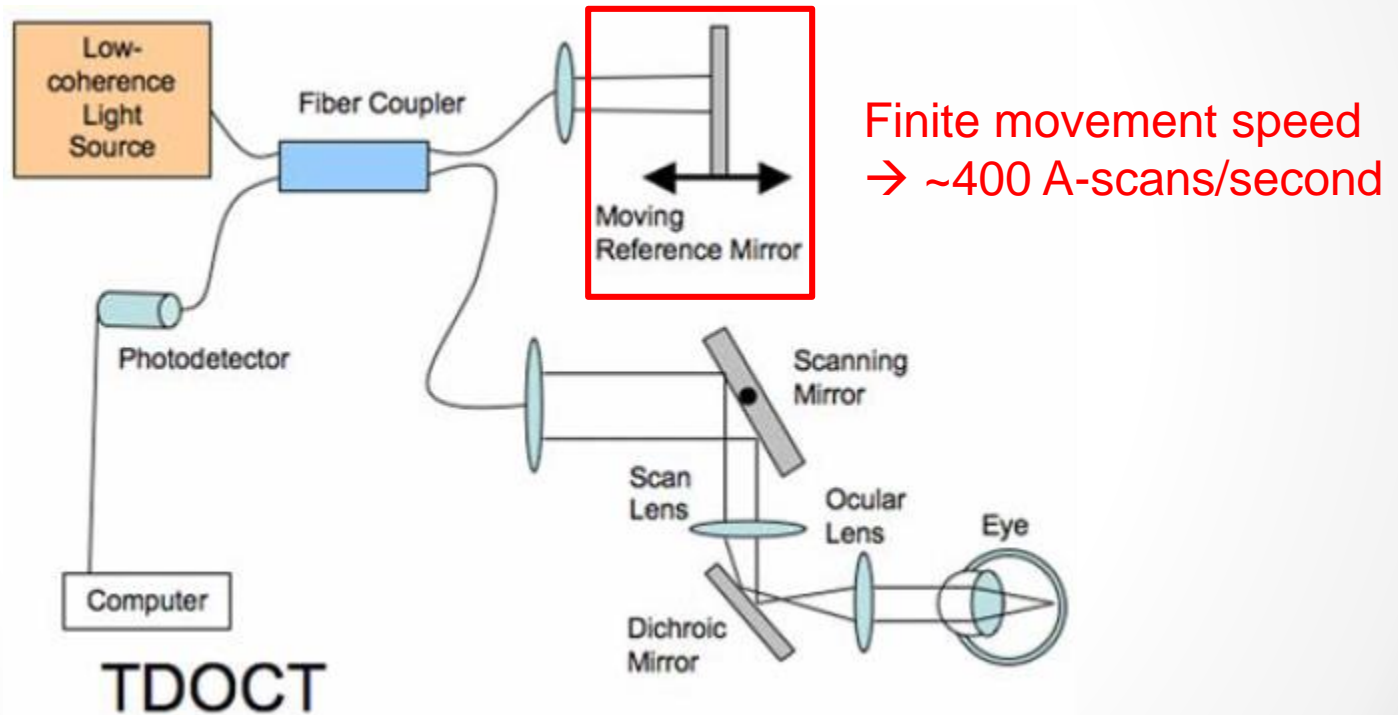

Short Coherence Length Light

# History

- Time Domain
- Fourier or Spectral Domain

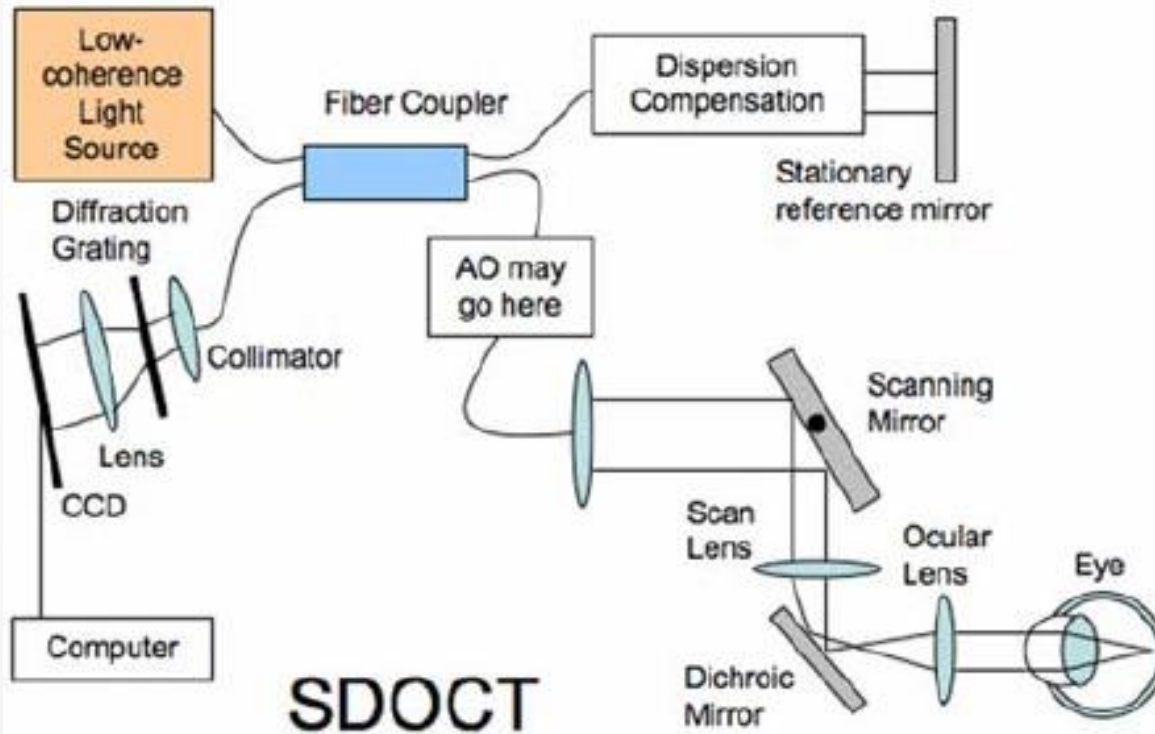

# Time-Domain OCT

Schuman, 2008

# Spectral-Domain OCT

Interference pattern  
split into frequency  
components

→ 40-100x faster than  
TD-OCT

= less motion artifact

Schuman, 2008

# Anterior Segment OCT

- Cross-sectional images of the angle, cornea, and anterior chamber structures
- Assessing narrow or suspicious angles
- Evaluating corneal pathology
- Managing blebs and Descemet's membrane surgeries

# 1310 nm vs 830 nm

1310 nm

- Dedicated system
- Time-domain
- Longer wavelength allows for greater depth of imaging

830 nm

- Converted from retinal scanner
- Spectral domain
- Higher resolution but imaging depth is limited

# Interpretation – Qualitative

- Tan, A. et al. Reproducibility of anterior chamber angle measurements with anterior segment optical coherence tomography. *Glaucoma*; April 2011

# Interpretation – Quantitative

AOD: Angle opening distance

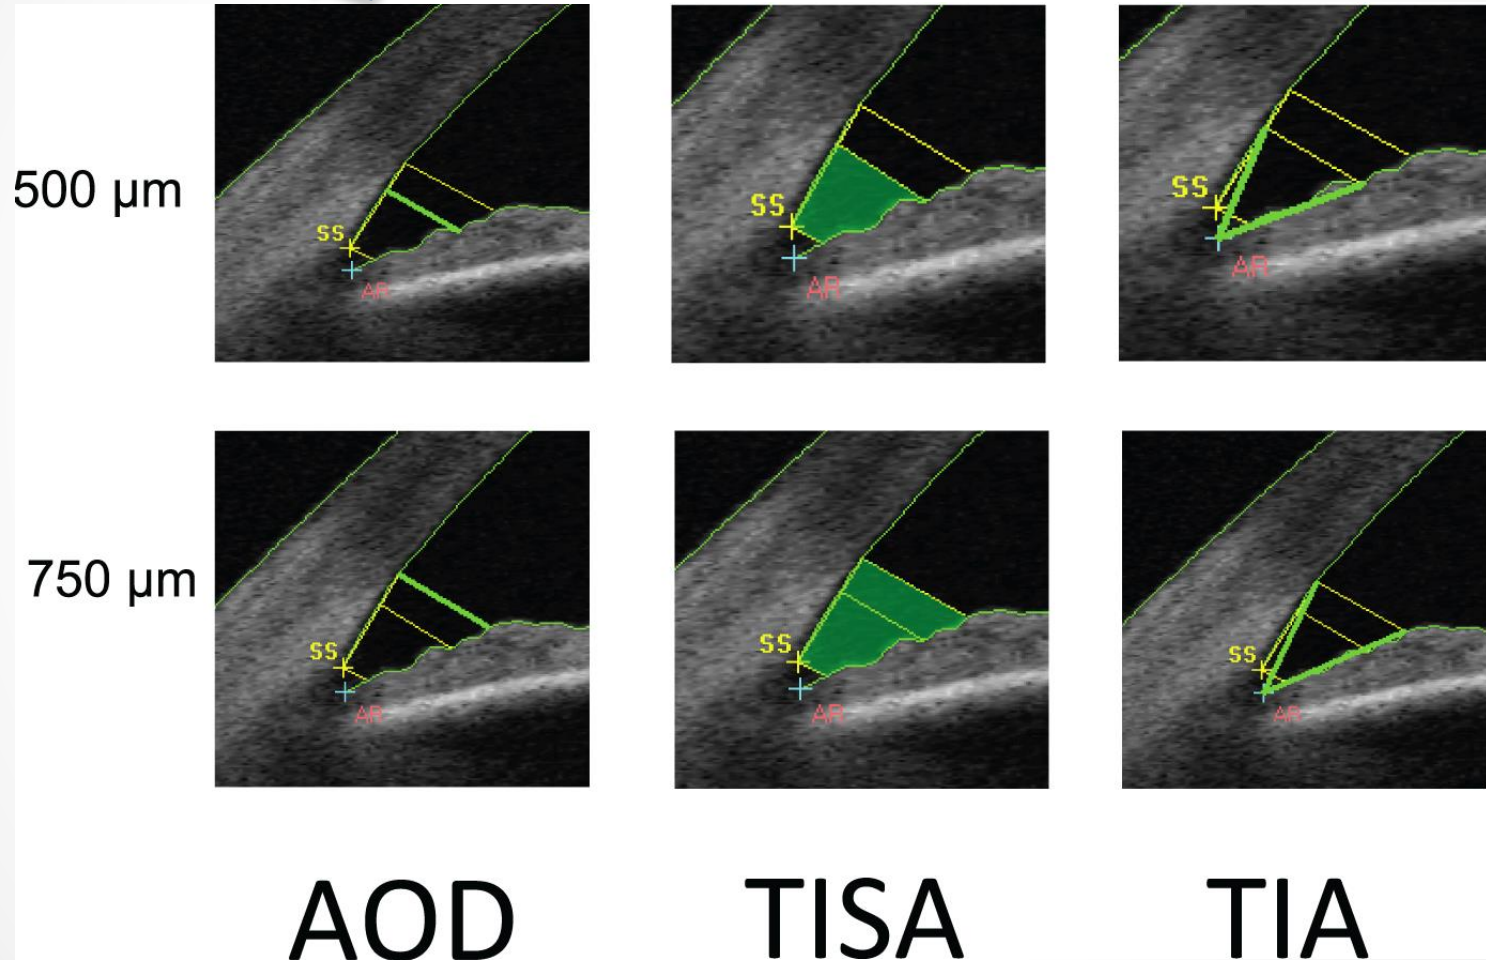

TISA: Trabecular-iris space area

TIA: Trabecular-iris angle

- Measured at 500 um or 750 um anterior to scleral spur
- Scleral spur must be identified manually
- “Normal” values vary by refractive state, ethnicity, quadrant analyzed

# Interpretation – Quantitative

Sanchez-Parra, L. et al. Diurnal IOP and the relationship with SS OCT-derived anterior chamber dimensions in angle closure: The IMPACT study. IOVS; May 2015

# Interpretation – Quantitative

ACD: Anterior chamber depth

ACW: Anterior chamber width

LV: Lens vault

- Shallow anterior chamber depth
- Increased lens vaulting
- Decreased anterior chamber width
- Greater iris thickness and curvature

# Glaucoma – Angle assessment

- Useful when gonioscopy is not feasible due to corneal pathology or lack of patient cooperation
- Able to image the angle in the dark when occludable angles are more likely to be narrow or even closed

# Glaucoma – Narrow angle

# Glaucoma – Narrow angle

# Glaucoma – Closed angle

# After laser iridotomy

- Determine patency of laser peripheral iridotomy (LPI)
- Evaluate success of LPI (iris plane should flatten)

# Cyclodialysis cleft

Suprachoroidal fluid

Separation of ciliary body from sclera

# Bleb assessment

- Imaging at 2 weeks can predict bleb functionality at 6 months

- BW = Bleb wall
- SF = Subconjunctival fluid
- SSF = Suprascleral fluid
- R = Route under scleral flap
- SF\* = Scleral flap
- SS = Sclerotomy site

# Bleb assessment

## Good bleb function

- Multiform bleb wall reflectivity
- Large internal fluid-filled cavity
- Extensive hyporeflective area
- Thinner, hyporeflective bleb walls
- More microcysts

## Poor bleb function

- Uniform reflectivity of bleb
- Ostium occlusion
- Apposition of conjunctiva-episclera to sclera

# Corneal imaging

- Useful adjunct in evaluating corneal infiltrates, corneal dystrophies, and managing Descemet's membrane surgeries

# Microbial keratitis

Konstantopoulos, A et al. In vivo quantification of bacterial keratitis with optical coherence tomography. *Cornea*; Feb 2011

# Descemet's membrane imaging

Descemet's membrane  
detachment after cataract surgery

Adherent graft after Descemet's  
stripping endothelial keratoplasty  
(DSEK)

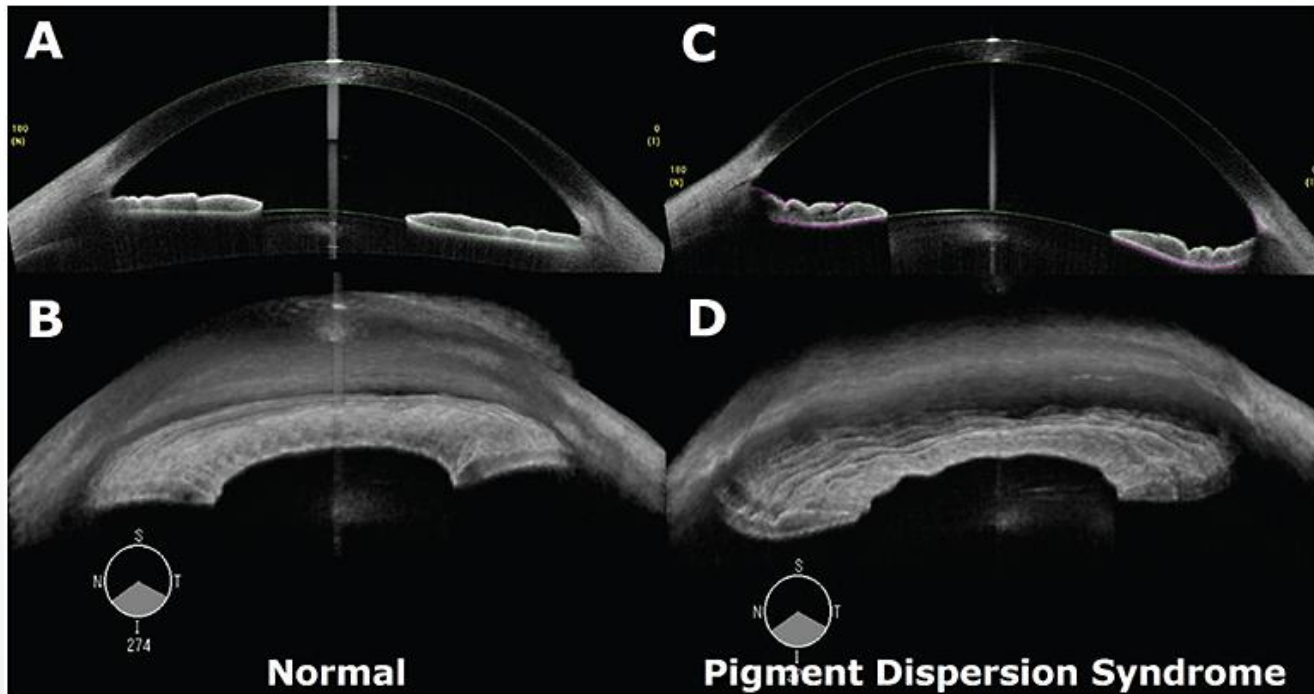

Graft detachment after DSEK

# Limitations

- Incomplete imaging beyond the sclera or iris pigment epithelium make AS-OCT less useful in diagnosing posterior mechanisms of angle closure (iridociliary lesions, plateau iris)
- Inability to visualize the trabecular pigment or narrow bands of peripheral anterior synechiae
- Quantitative measurements for angle assessment not routinely used
  - Difficulty in identifying the scleral spur (15-28%)
  - Wide natural variation in angle anatomy within the same eye and between eyes

# Future directions

COURTESY JUNG MIN LEE, MD AND SUNG CHUL (SEAN) PARK, MD

# Questions?

# Optic Nerve

- Retinal Nerve Fiber Layer OCT

# OCT - RNFL

- RNFL is measured in the peripapillary region by performing a circular scan centered around the optic disc (3.4 mm diameter)
- Compared with age-matched controls
  - Green – 5<sup>th</sup>-95<sup>th</sup> percentile
  - Yellow – 1<sup>st</sup> -5<sup>th</sup> percentile
  - Red – below 1<sup>st</sup> percentile
- Multiple manufacturers – Zeiss, Heidelberg, Optovue

## Case #10

Disc pallor → optic neuropathy  
Not glaucoma!

# OCT-RNFL Pearls

- An OCT scan is only as good as the clinician who's interpreting it
- Glaucoma is a **progressive** disease, so **repeat, repeat, repeat** the testing until you are sure
- Don't forget to look at the whole eye!

# Questions?

# Macula

- Normal Macula (histologic vs OCT)

Choroidal Neovascular Membrane

Diagnosis:

Exudate Age-related Macular Degeneration

# Case #4

# Case #4

Idiopathic Juxtafoveal Telangiectasis/Macular  
Telangiectasia/MacTel Type II

# Artifacts

- Off-center: Fixation error
- Motion Artifact: eye/head movement
- Degraded image: poor image acquisition from opaque media
- Cut edge: edge of scan is truncated
- Out of Register: scan shifted outside of acquisition gates
- Mirror Artifact: high myopes, longer axial lengths
- Movement: Eye or head, Blink
- Misidentification of Retinal layers (Inner or Outer)
- Shadows
- Blink

Artifact	Correction
Inner Layer Misidentification	Manual Correction
Outer Layer Misidentification	Manual Correction
Mirror Artifact	Retake scan in area of interest
Degraded Image	Repeat scan after addressing issue
Out of Register	Repeat scan after realigning
Cut edge	Ignore
Off Center	Retake scan or manually correct
Motion Artifact	Retake Scan
Blink Artifact	Retake Scan

# Questions?

# New and Coming Attractions

- OCT Angiography
- Swept Source OCT

# OCT-Angiography

Chen et al, 2015

Uses available Fourier-domain OCTs

Subtraction of volumetric scans at different time points

Advantages over FA and ICG angiography:

- No dye / non-invasive
- 3 dimensional (volumetric) scan
- Faster

# Swept-Source OCT

Schuman, 2008

Tunable laser source allows use of single photodetector rather than CCD array

→ ~500x faster than TD-OCT  
→ 5-13x faster than SD-OCT

= even less motion artifact  
= greater scan density  
= greater transverse resolution for visualizing axons, blood vessels, even individual retinal cells
